Attempt : 1
Total Mark : 10
Marks Obtained : 10

Section 1 : Coding

1. Problem Statement

In a secure banking system, customers are required to create PIN codes for accessing their accounts. The bank wants to validate these PIN codes before accepting them.

A PIN code is considered valid if:

It consists of exactly 4 digits.All characters must be numeric (0–9).It cannot contain all identical digits (e.g., 1111 is invalid).

Your task is to determine whether each PIN code in the list is valid or not.

Input Format

The first line of input contains an integer T, representing the number of PIN codes to check.

The next T lines each contain a string S, representing a PIN code.

Output Format

For each PIN code S, the output print "YES" if it is valid.

Otherwise, the output print "NO".

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 1
1234
Output: YES

Answer

```
// You are using Java
import java.util.Scanner;

class PinCodeValidator {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        int T = Integer.parseInt(scanner.nextLine());

        for (int i = 0; i < T; i++) {
            String pin = scanner.nextLine();

            if (isValidPin(pin)) {
                System.out.println("YES");
            } else {
                System.out.println("NO");
            }
        }

        scanner.close();
    }

    private static boolean isValidPin(String pin) {
        if (pin.length() != 4) {
```

```
            return false;
        }

        for (char ch : pin.toCharArray()) {
            if (!Character.isDigit(ch)) {
                return false;
            }
        }

        char firstChar = pin.charAt(0);
        for (int i = 1; i < pin.length(); i++) {
            if (pin.charAt(i) != firstChar) {
                return true;
            }
        }

        return false;
    }
}
```

Status : Correct **Marks : 10/10**
